An aerial photograph of a two-lane asphalt road winding through a dense, lush green forest. A white van is driving on the road, moving away from the viewer. The trees are thick and vibrant green, with some sunlight filtering through the canopy. The road has white double lines in the center and single lines on the edges.

“Inequalities in health arise  
because of inequalities in society  
- in the conditions in which  
people are born, grow, live, work  
and age”

Fair Society, Healthy Lives: The Marmot  
Review

# Introduction

## Context

The ISLHD Community Health Needs Assessment details different needs of the region based on physical environmental, socio-demographic, health prevalence and hospital admission indicators of the District.

This document uses data from two different sources; from the Australian Urban Observatory (AUO) and from the Public Health Information Development Unit (PHIDU), and analyses the identified needs at the suburb and 'Population Health Area' (PHA) level. This offers the benefit of giving an overview of the needs of the ISLHD community at a more granular level than the Local Government Area (LGA) level, which is commonly used for the clinical service planning process of services offered from the Districts hospitals.

This data is divided by the Districts four LGA regions; Wollongong, Shellharbour, Kiama and Shoalhaven. Each region has the following number of PHAs and suburbs:

Region	PHAs	Suburbs
Wollongong	10	55
Shellharbour	4	14
Kiama	1	5
Shoalhaven	8	No AUO data

PHIDU has created these areas using the ABS's Statistical Area 2's (SA2). More information regarding PHA's can be found at <http://phidu.torrens.edu.au/help-and-information/about-our-data/geographical-structures/pha-overview>.

## Updates from previous Community Needs Assessment

This updated addition includes additional data from both PHIDU and from the AUO. From PHIDU, this version of the needs assessment includes more recent data, as well as admission and ED attendance data, which is compared against the areas of identified need. The AUO data that is included analyses livability rates at the suburb level.

New to this version is the inclusion of data regarding the major contributors to the national burden of disease as well as the modifiable risk factors that impact that burden. In addition, there are area profiles that have been added for the three major areas of need that have been identified in the region.

The maps on the following several pages display varying comparisons and correlations based on the need of the Districts population.

### First 2000 days:

The first 2000 days map uses data from the Australian Early Development Census to display rates of vulnerabilities in 2 or more areas. This data provides an overview of a child's development when they first enter school across five different indicators, which include physical health, social competence, emotional maturity, language and cognitive skills, and communication skills.

This map demonstrates that there are high priority areas around Lake Illawarra, which have some of the highest rates of vulnerabilities in the state.

## ISLHD social and health indicators:

Comparing all PHA's across the state, the maps display the correlation between social and health related indicators in ISLHD. The needs assessment analyses 61 social-related indicators and 51 health-related indicators in order to identify the areas of need in the region.

It can clearly be seen that areas with high social disadvantage also have high health disadvantages

## ISLHD total need - all indicators:

A total of 112 indicators across both the social and health areas provide an overview of the health and well-being for ISLHD residents. This map is the key output of these indicators. All the maps on the subsequent pages are then compared against this map, which is the total measure of ISLHD communities health and well-being.

## ISLHD need and admission rates:

These maps compare the total needs in the region against admission and ED presentation rates at public hospitals across 74 different indicators. This allows for the comparison of needs in the community against ISLHD services rates, and allows for the investigation of areas that may be either over or under serviced based on their indicated need.

## ISLHD health workforce ratios:

These maps display the rates of healthcare workers per 100,000 population across several different categories including general practitioners and dental practitioners, and compares the ISLHD LGA against the rest of New South Wales.

This data is only available at the LGA level.

## ISLHD need and population density:

Comparing all PHA's across the state, the maps display the comparison between the overall need throughout ISLHD and how the Districts population is distributed geographically. Of note, Southern Illawarra has some areas that are the most disadvantaged in NSW and also have high population density. Shoalhaven has some areas that are the most disadvantaged in NSW, however these areas also have very low population density.

### Glossary of commonly used acronyms:

**ABS:** Australian Bureau of Statistics

**AUO:** Australian Urban Observatory

**LGA:** Local Government Area

**LHD:** Local Health District

**PHIDU:** Public Health Information Development Unit

**PHA:** Population Health Areas

**SA2:** Statistical Area 2

# How to read this document

This document compares areas within the Illawarra Shoalhaven against the performance of rest of the state. Much of this data is represented by placing data into quintiles.

This is displayed throughout the document by different coloured boxes. Areas that fall within the 0 to 20th percentile are identified as areas of high priority, meaning that they are in the most disadvantaged in the state for that indicator. This is often

represented by the example below.

Scores for other total social, health, and overall need are calculated through counting how many times an area falls into each quintile across all indicators. The more often an area falls into the more disadvantaged quintiles, the higher its need score is. This is done for every indicator for every area in the state, which provides a state-wide analysis of need and allows for the comparison of all areas for all indicators.

Least disadvantaged in NSW	Q1	80 <sup>th</sup> - 100 <sup>th</sup> percentile
	Q2	60 <sup>th</sup> - 80 <sup>th</sup> percentile
	Q3	40 <sup>th</sup> - 60 <sup>th</sup> percentile
	Q4	20 <sup>th</sup> - 40 <sup>th</sup> percentile
Most disadvantaged in NSW	Q5	1 <sup>st</sup> - 20 <sup>th</sup> percentile

# An Overview of ISLHD

**70,000** ISLHD residents live in the most disadvantaged **6%** of the entire state

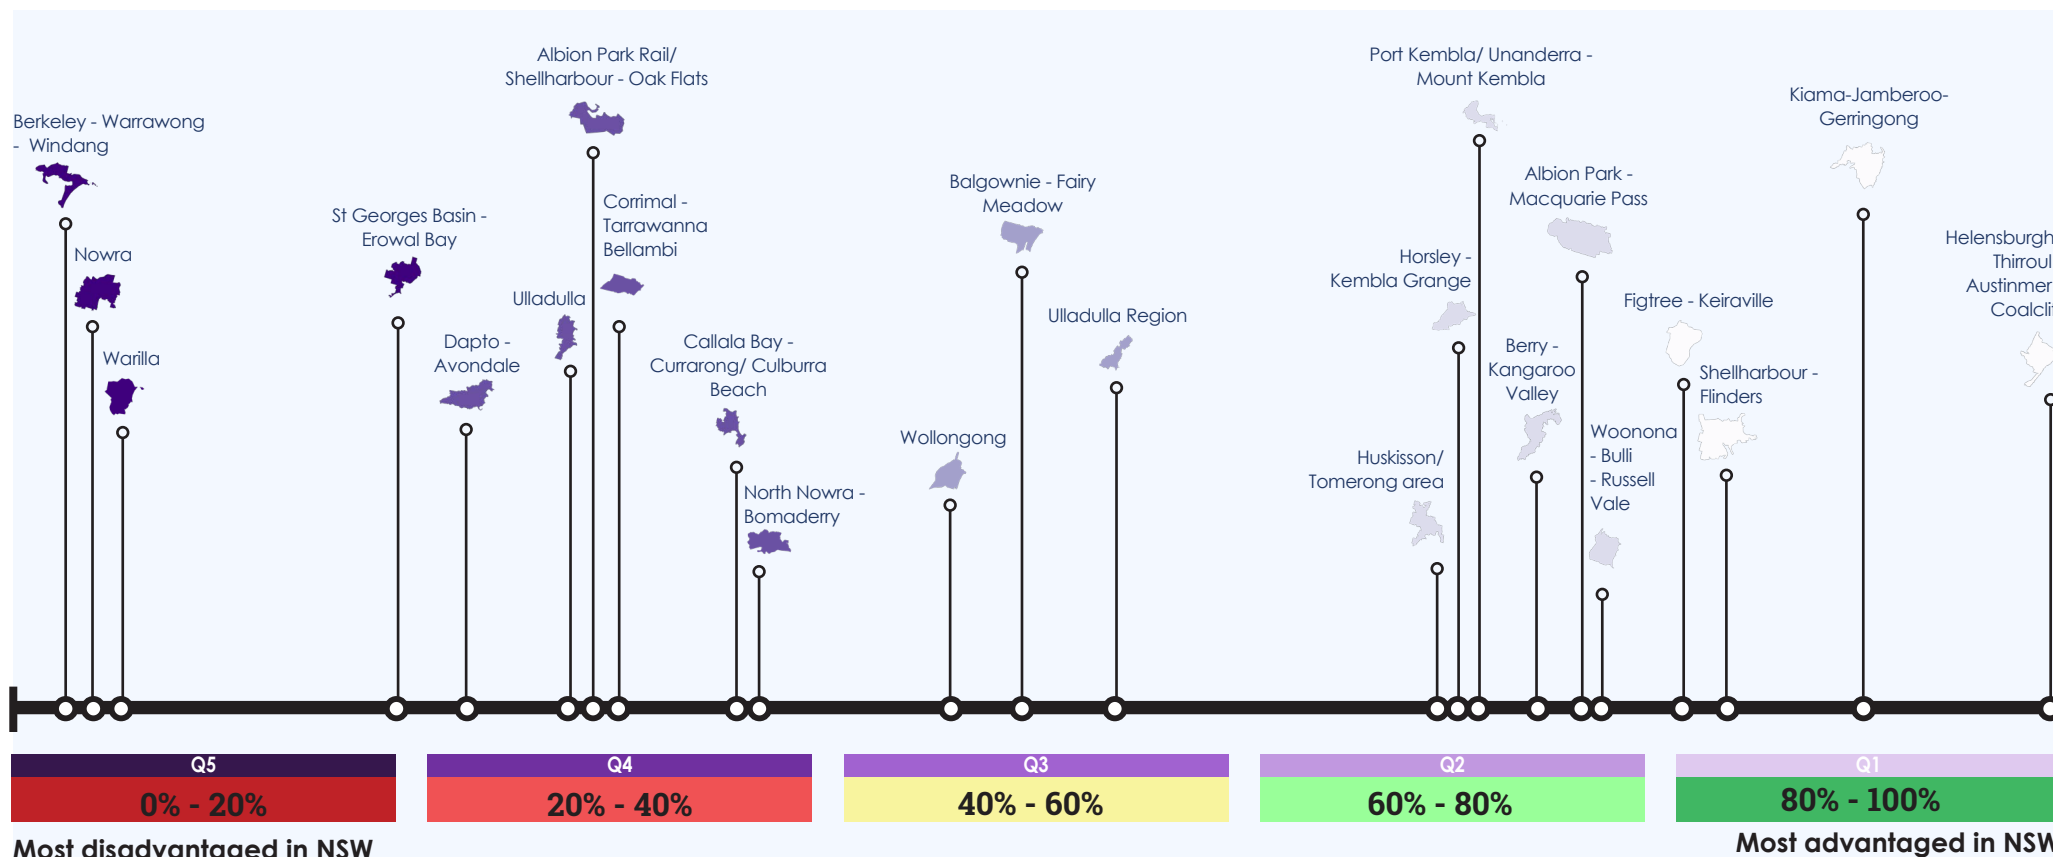

This is nearly **1 in 5** people

## Population breakdown of each quintile:

Q5:	Q4:	Q3:	Q2:	Q1:
89,156	97,824	59,025	76,605	82,007
22%	24%	15%	19%	20%

Our most advantaged area is better off than **98%** of NSW

However, this area is in the **43rd** percentile of the state for admissions and ED presentations

# Modifiable Risk Factors

These **5** risk factors contribute to nearly **30%** of the total burden of disease in Australia.

# ISLHD Need and Service Locations

“Because the presence or absence of health care has the potential to directly impact emergent health outcomes in a neighbourhood, the neighbourhood itself becomes an important unit of analysis for examining health care accessibility.” - Neighbourhoods and potential access to health care: The role of spatial and aspatial factors

ISLHD services are well distributed to meet the needs of the District. The current opportunities for improvement are to increase access to community services in the area on the east of Lake Illawarra. These are priority areas for the District, with high population density and with few services in close proximity.

Other opportunities to better match the distribution of services with the need of specific areas would be add more community services in the north of Wollongong, as well as offering greater coverage of outreach services in the Shoalhaven.

# The Australian Urban Observatory

**“A liveable place** is somewhere that is: safe, attractive, inclusive, and environmentally sustainable; with affordable and diverse types of housing, public open space, local shops, health and community services, leisure and cultural opportunities; with opportunities for employment and education all accessible by convenient public transport, walking and cycling.”

- Australian Urban Observatory

The Australian Urban Observatory (AUO) is a digital platform that transforms complex urban data into easily understood liveability maps across Australia's 21 largest cities. The maps and data provided in this report regarding the liveability and other indicators are at the suburb level for the city of Wollongong, which ranges from Helensburgh in the north down to Kiama in the south. At this stage, as the AUO only provides data for major urban areas across Australia, there is no data available for the Shoalhaven region.

The data is provided across 9 different domains and includes 34 different indicators.

All data is licensed from the Australian Urban Observatory. More information can be found at <https://auo.org.au/>

## The 9 domains:

-  Liveability
-  Walkability
-  Social infrastructure
-  Alcohol environment
-  Public transport
-  Food environment
-  Public open space
-  Environment
-  Housing affordability

# Wollongong City Overview

The average number of social infrastructure destinations accessible within recommended distances from dwellings across all areas of Wollongong is **6** out of a total of **16**

## Overview:

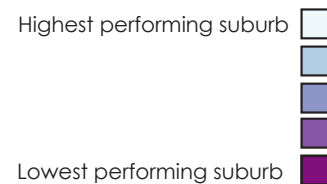

Of note for the city of Wollongong, for nearly all indicators, the further the suburb is from the more dense city centre, the lower the scores that suburb receives. Areas with the lowest scores are often in the northern and western suburbs, where there are fewer services, less infrastructure, and lower population density.

Of interest is the fact that areas that have been identified within the PHIDU data as having lower levels of need in out District, such as in the north, are identified within the AUO data as being less liveable. This may be due to the physical make-up of the area and how remote it is from the city centre.

## The Liveability Index:

The Australian Urban Observatory provides an overarching indicator, the Liveability Index, which "... combines the domains of liveability found to be associated with health and wellbeing outcomes: walkability and access to social infrastructure, public transport, larger public open space, affordable housing and local employment."

This single indicator provides a good overview of how an area will perform across all indicators.

LIVEABILITY

SOCIAL INFRASTRUCTURE

LOCALLY EMPLOYED

HOUSING AFFORDABILITY

# Wollongong City Walkability

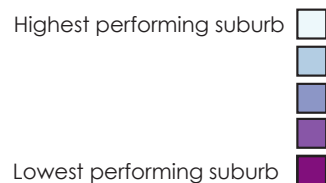

## Overview:

“Walkability measures the ease of walking in an area. Neighbourhoods with shops and services to walk to, small blocks and good street connectivity, and higher population density tend to be more walkable.

Walkability is calculated as a composite index that includes access to daily living destinations (something to walk to), dwelling density (population needed to supply services and destinations) and street connectivity (a way to get there) within a reasonable walking distance of home.”

- AUO Scorecard Wollongong

AVG. DISTANCE TO CLOSEST  
ACTIVITY CENTRE

AVG. DWELLING DENSITY PER  
HECTARE

AVG. STREET CONNECTIVITY  
PER KM<sup>2</sup>

AVG. NUMBER OF OF DAILY  
LIVING DESTIONS WITHIN 1.6<sup>KM</sup>

WALKABILITY FOR TRANSPORT  
INDEX

# Wollongong City Public Transport

The percentage of residences with proximate access to regular public transport in Wollongong is

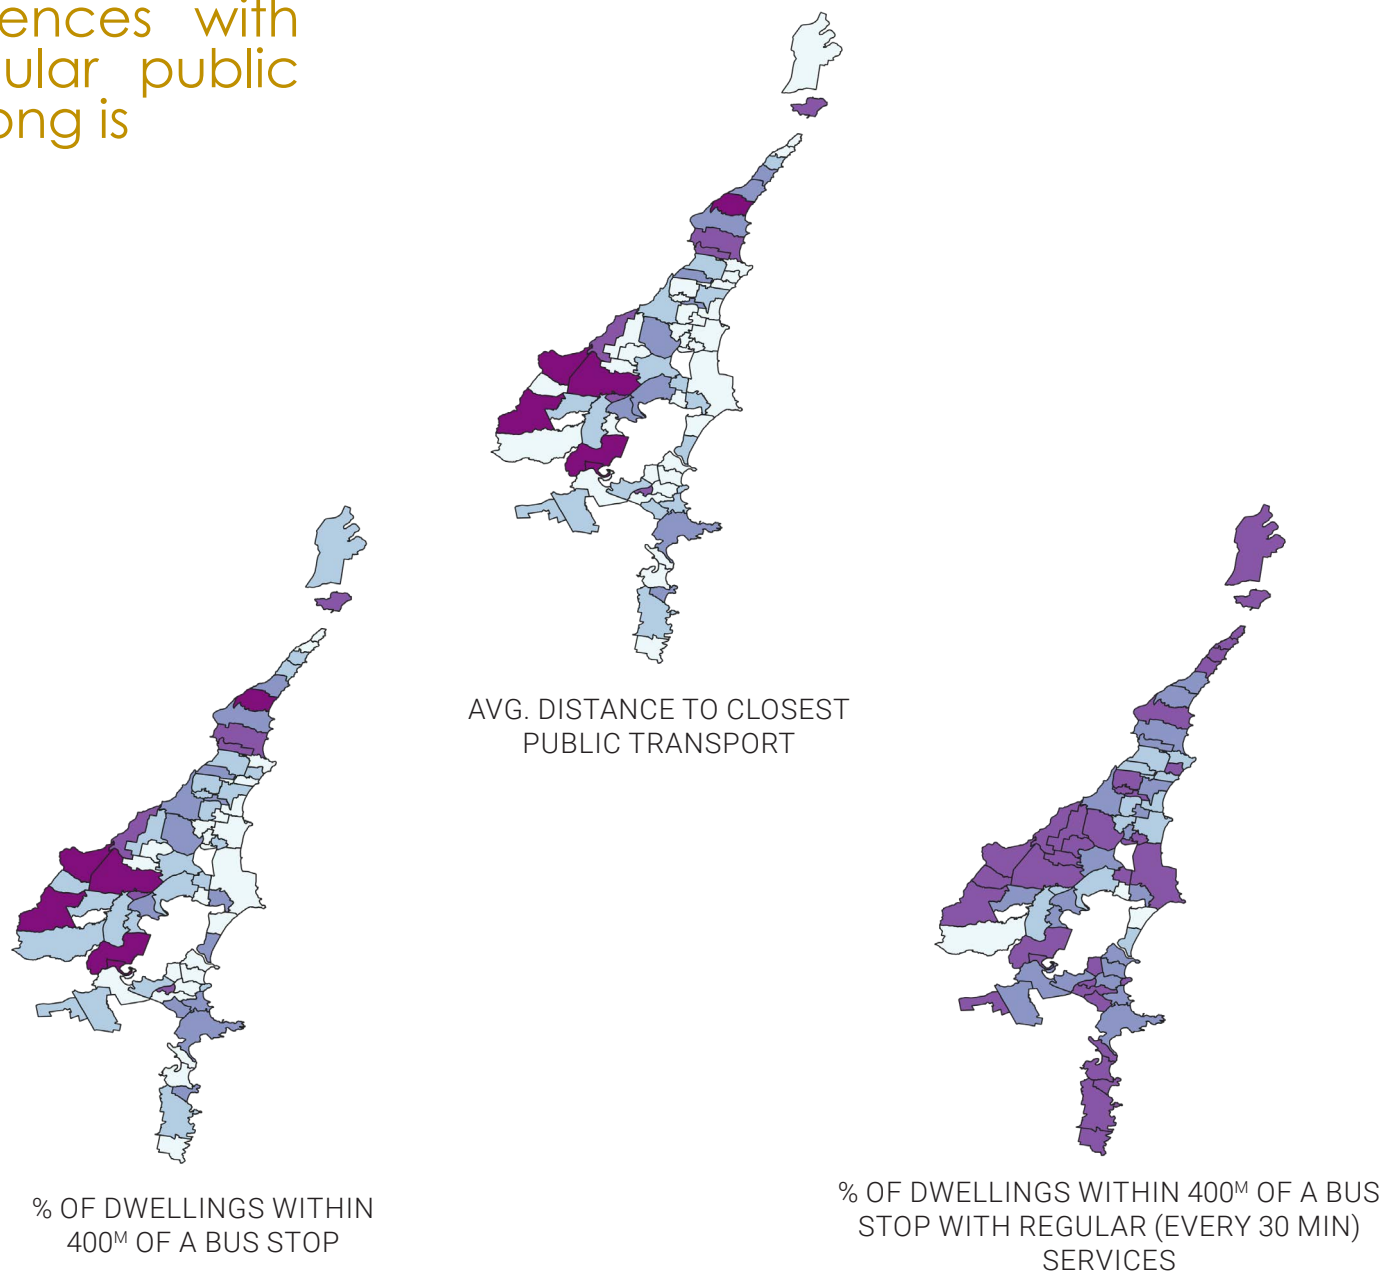

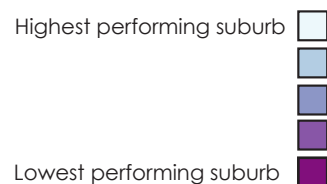

33%

## Overview:

“Living close to public transport supports health and wellbeing in a number of ways: by encouraging walking and reducing dependence on driving; and, providing residents with access to employment and amenities.

People who live close to public transport are more likely to use it, and in turn achieve daily recommended physical activity. Having a public transport stop near home and work, increases the likelihood of using public transport. While living within 400m of a public transport stop with a service every 30 minutes, is likely to encourage more walking .”

- AUO Scorecard Wollongong

# Wollongong City Food and Alcohol Environment

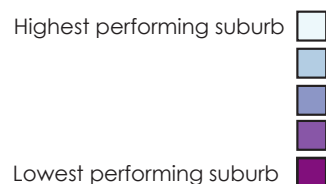

## Overview:

"Being close to a supermarket supports healthy eating and active living by providing easy access to fruit, vegetables and healthy food within a walkable distance. In disadvantaged areas, living within 800m of a supermarket reduces the risk of overweight and obesity.

Access to alcohol has been linked to harmful alcohol consumption and alcohol-related violence. For those living in disadvantage areas where there are fewer alcohol outlets, there appears to be a protective affect with enhanced self-reported health."

- AUO Scorecard Wollongong

% OF HOUSES WITHOUT ANY FOOD OUTLET WITHIN 3.2<sup>KM</sup>

% OF HOUSES WITHIN 1<sup>KM</sup> OF A SUPERMARKET

AVG. DISTANCE TO CLOSEST FAST FOOD OUTLET

AVG. DISTANCE TO CLOSEST HEALTHY FOOD OUTLET

AVG. DISTANCE TO CLOSEST OFF-LICENCE VENUE

AVG. DISTANCE TO CLOSEST ON-LICENCE VENUE

# Wollongong City Public Open Space

The percentage of Wollongong residences living within 400m of public open space of at least 1.5 hectares is

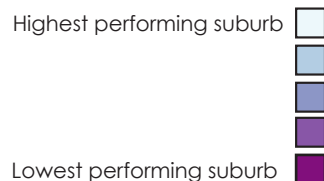

**43%**

## Overview:

"Public open space includes parks, open areas and places where people can congregate for active and passive recreation and enjoyment. Parks are one form of public open space that usually include grassed areas and gardens, and some green recreational space. Parks support both the physical and mental health of people living nearby and are important for supporting the local ecology and biodiversity of an area."

- AUO Scorecard Wollongong

% OF HOUSES WITHIN 400<sup>M</sup> OF ANY LOCAL PARK (>0.4<sup>HA</sup> - <1<sup>HA</sup>)

AVG. DISTANCE TO CLOSEST PUBLIC OPEN SPACE

% OF HOUSES WITHIN 400<sup>M</sup> OF PUBLIC OPEN SPACE

# Data Sources

## Public Health Information Development Unit (PHIDU)

The PHIDU is located at Torrens University Australia and provides free online access to a range of data, highlighting socioeconomic and geographical variations in health. More information about the unit, as well as metadata on all indicators can be found at [here: https://phidu.torrens.edu.au/help-and-information/help-guides-and-faq/accessing-the-notes-on-the-data](https://phidu.torrens.edu.au/help-and-information/help-guides-and-faq/accessing-the-notes-on-the-data)

## Methodology

Need scores are calculated through counting how many times an area falls into each quintile across all indicators. The more often an area falls into the lower quintiles, the higher its need score is. This is done for every indicator for every area in the state, which provides a state-wide analysis of need and allows for the comparison of all areas for all indicators.

An example is provided below:

	Social					Health					Total										
Quintile	5	4	3	2	1	5	4	3	2	1											
Count	42	8	7	1	3	7	7	7	14	17	397										
Methodology	42x5	+	8x4	+	7x3	+	1x2	+	3x1	+	7x5	+	7x4	+	7x3	+	14x2	+	17x1	=	397

## Admission indicators:

Indicator	Year	Data Source
Admissions by Principle Diagnosis		
Infectious and parasitic diseases	2017/18	Australian Institute of Health and Welfare
All cancers		
Endocrine, nutritional and metabolic diseases		
Diabetes		
Mental health related conditions		
Mood affective disorders		
Nervous system diseases		
Eye and adnexa diseases		
Ear and mastoid process diseases		
Circulatory system diseases		
Ischaemic heart disease		
Heart failure		
Stroke		
Respiratory system diseases		
Asthma		
Chronic Obstructive Pulmonary Disease (COPD)		
Digestive system diseases		
Skin and subcutaneous tissue diseases		
Musculoskeletal system and connective tissue diseases		
Genitourinary system diseases		
Chronic kidney disease		
Certain conditions originating in the perinatal period		
Congenital malformations, deformations and chromosomal abnormalities		
Injury, poisoning and other external causes		
Admissions by Procedure		
Tonsillectomy	2017/18	Australian Institute of Health and Welfare
Myringotomy, 0 to 9 years		
Hysterectomy, females aged 30 to 59 years		
Caesarean section, females aged 15 to 44 years		
Birth with an outcome of delivery, females aged 15 to 44 years		
Coronary artery bypass graft		
Coronary angioplasty		
Cardiac catheterisation		
Hip fracture		
Knee replacement		
Knee arthroscopy		
Fibre optic colonoscopy		
Fibre optic colonoscopy excision
